

Sawariya Solution — Website & Admin CMS

A marketing website and a database-backed content management system (CMS) for a Vadodara-based IT studio. A plain HTML/CSS/JS frontend powered by a Laravel + SQLite backend with a REST API and an admin panel.

Laravel 13

PHP 8.3

SQLite

JavaScript

REST API

1. Project Overview

Sawariya Solution is a small IT studio in Vadodara that builds web, software, mobile, and cloud products for businesses across India. This project is their official website together with a built-in admin panel (CMS) to manage all the site content.

- The **frontend** is framework-free — one stylesheet and two small scripts — giving a fast, responsive, fully fluid marketing site.
- Behind it sits a small **Laravel REST API** that stores all content in a **SQLite database**, so the admin panel edits real data (not just a browser's local storage).
- If the API is ever unavailable, the site automatically falls back to its bundled default content and still renders correctly.

2. Technology Used

LAYER	TECHNOLOGY
Backend framework	Laravel 13 (PHP 8.3+)
API authentication	Laravel Sanctum (Bearer token)
Database	SQLite (file-based) — MySQL optional
Frontend	HTML5, CSS3, Vanilla JavaScript (no framework)
Fonts	Plus Jakarta Sans, Space Mono (Google Fonts)
Package manager	Composer
Local server	<code>php artisan serve</code> (or <code>start.bat</code>)

3. Installation Steps

You need **PHP 8.3+** and **Composer**. On Windows, **Laragon** or **XAMPP** bundles both. (No separate database server is required — the project uses SQLite.)

```
# 1. Install PHP dependencies
composer install

# 2. Create your environment file
copy .env.example .env          # macOS/Linux: cp .env.example .env

# 3. Generate the application key
php artisan key:generate

# 4. Create the database, tables, content, and admin user
php artisan migrate --seed
```

That's it — the project is ready to run.

4. How to Run the Project

Easiest way (Windows): Double-click `start.bat` in the project folder. A window opens and runs the server — keep that window open while you use the site. Close it to stop.

Or from the terminal:

```
php artisan serve
```

PAGE	URL
Public website	http://localhost:8000/
Admin panel (CMS)	http://localhost:8000/admin/

Frontend-only preview (optional): you can serve the `public/` folder statically (e.g. VS Code Live Server on port 3000). The pages render from their bundled defaults, but the admin still needs the backend running on port 8000 to log in and save.

5. Database Setup

This project uses **SQLite by default** — a single file, no database server to install or start.

```
php artisan migrate --seed
```

This command creates the database file `database/database.sqlite`, builds all tables, loads all site content from `database/seeder/data/content.json`, and creates the **admin user** (`admin` / `admin`).

To reset / reload the database:

```
php artisan migrate:fresh --seed
```

To use MySQL instead (optional): in `.env` set `DB_CONNECTION=mysql` with your credentials, create a database named `sawariya`, then run `php artisan migrate --seed`.

6. Configuration / Important Files

FILE / FOLDER	PURPOSE
<code>.env</code>	Environment config (database, app key, sessions). Created from <code>.env.example</code> .
<code>start.bat</code>	One-click launcher for the backend server (Windows).
<code>routes/web.php</code>	Serves the public site and the <code>/admin</code> panel.
<code>routes/api.php</code>	The REST API (login, content, collections, singletons, uploads).
<code>app/Http/Controllers/Api/</code>	API controllers (Auth, Content, Collection, Singleton, Upload).
<code>app/Models/</code>	Eloquent models — Entry, Singleton, User.
<code>database/seeder/</code>	ContentSeeder + data/content.json (initial site content).
<code>public/</code>	The frontend — all *.html pages, CSS, JS, images.
<code>public/css/style.css</code>	The entire design system (colours, type, layout).
<code>public/js/data.js</code>	Bundled content defaults (offline fallback).
<code>public/admin/admin.js</code>	The schema-driven admin/CMS engine.

7. Features / Modules

Public website

- **Home** — rotating hero banner, key stats, client logos, services, Industries We Serve, why-us, process, products, portfolio, testimonials, blog and a call-to-action.
- **About, Services, Products, Portfolio, Blog, Careers, Contact** pages.
- Fully **responsive** and **fluid** — the whole layout scales with the screen size and browser zoom; respects reduced-motion and keyboard focus.

Admin Panel (CMS) — /admin/

- Schema-driven editor for every part of the site: banner slides, services, products, portfolio, testimonials, blog posts, job openings, clients, partners, milestones, social links, settings/SEO, contact info and footer.
- **Image uploads** with live preview (saved to `public/images/uploads/`).
- Changes are saved to the database and appear on the public site on its next load.

Backend / API

- REST API with **Sanctum token authentication** (public reads need no auth).
- Flexible content storage: list items in an `entries` table, single records in a `singletons` table.
- Graceful **offline fallback** to bundled defaults if the API is unreachable.

8. Things to Update After Setup

- Run `php artisan key:generate` if you haven't (sets `APP_KEY`).
- **Change the admin password** — it ships as `admin` / `admin` for demo use only.
- Update the real business content through the **admin panel** (or in `public/js/data.js`).
- Update **contact details, social links and SEO** in the admin Settings/Contact sections.
- For production: set `APP_ENV=production`, `APP_DEBUG=false`, and configure a real database/mail service if required.

9. Admin Login Details

FIELD	VALUE
Admin URL	http://localhost:8000/admin/
Username	admin
Password	admin

The backend server must be running (use `start.bat` or `php artisan serve`). Tip: add `?demo=1` to the admin URL to auto-fill the demo login.
